

# Fattening

For pre-fattening and fattening we recommend a combination of TRAPPER and concrete crevices. Alternatively the smaller version "SMARAGD" can be used when less bearing load is needed.

**The plastic-concrete combination has essential advantages:**

- plastic panels provide a temperature neutral flooring
- concrete crevices ensure the necessary claw abrasion

**Furthermore, when compared to concrete, plastic panels are:**

- more durable
- easier to assemble
- quicker to clean
